

13.27 PLC Control

Overview

The PLC control object activates a specific operation when the corresponding control device is triggered.

Configuration

Click the "PLC Control" icon and the "PLC Control Object" summary appears as shown below.

LW150 LW151	Change window Write data to PLC(current base window) Concert DLC construct	
L99400 LB300	General PLC control Back light control(write back)	

Press the "New..." button and the "PLC Control" dialogue box appears. Set all the attributes of PLC control and press OK button, a new PLC control object will be created.

PLC Control		
Description :		
PLC name :	Local HMI	~
Attribute		
Type of control :	Change window	~
Active only w	Change window Write data to PLC(current base window)	
Turn on back	General PLC control Back light control (write back)	
Trigger address	Back light control Sound control	
PLC name :	Local HMI	Setting
Address :	LW 🗸 0	16-bit Unsigned
	ОК	Cancel

Setting	Description	
Attribute &	[Type of control]	
Trigger	To set the type of control. Click the select button and you can drag down a	
address	list of all available PLC control functions	
	Attribute Type of control : Change window Change window Write data to PLC(current base window) General PLC control Back light control(write back) Back light control Sound control Sound control Screen hardcopy	
	a. "Change window"	
	This is used to change base window. When the value of [Trigger address]	
	is written in a valid window number, the system will close the current	
	window and open the window designated by the [Trigger address]. The	

new window number will be written to the [Trigger address + 1]. PLC Control Description : PLC name : Local HMI ¥ Attribute Type of control : Change window Active only when designated window opened 10. WINDOW_010 V Turn on back light Clear data after window changed Trigger address PLC name : Local HMI Setting... ✓ 0 16-bit Unsigned Address : LW As an example of the above configuration. When writing a valid window number – 11 into LW0, the system will close the current window and open window 11, then write 11 into LW1 (LW0+1) If you use 32-bit device as trigger address, and the device type of the trigger address is in word basis, then the system will write the window number into [Trigger address +2]. Below is the list of write address for each different type of data format. Write address **Data Format Trigger address** Address + 1 16-bit BCD Address Address + 2 32-bit BCD Address Address Address + 1 16-bit Unsigned 16-bit Signed Address Address + 1 32-bit Unsigned Address Address + 2 Address + 2 Address 32-bit Signed Note: If [LB-9017] = ON, the write back operation will not be executed. If "Clear data after window changed" is selected, the [Trigger address] will be reset to 0 after new window is open. b. "Write data to PLC (current base window)" When the system changes the base window, the new window number will

be written into the [Trigger address].

c. "General PLC Control"

This function performs data transfer between PLC and HMI when users set appropriate value in [Trigger address].

Control code	Operation for data transfer
[Trigger address]	
1	PLC register → HMI RW
2	PLC register → HMI LW
3	HMI RW → PLC register
4	HMI LW \rightarrow PLC register

With this function the system uses four continuous word devices, please refer to the following explanation.

Address	Purpose	Description
[Trigger	Control code	The valid control code is listed
address]		in the above table. When a new
		control code is written into the
		register, the system will conduct
		the data transfer function.
[Trigger	Number of words to	
address+1]	transfer	
[Trigger	Offset to the start	If the value is "n", the start
address+2]	address of PLC	address of PLC register is
	register	"Trigger address + 4 + n".
[Trigger	The start address of	
address+3]	LW or RW	
[Trigger address+3]	register The start address of LW or RW	"Trigger address + 4 + n"

As an example, to transfer PLC registers [DM100, 101 ... 105] to HMI [RW10, 11 ... 15], follow the steps below:

- 1. Set Trigger address to DM10.
- 2. Set [DM11] = 6 (no. of words to transfer)
- 3. Set [DM12] = 86 (DM10+4+86= DM100)
- 4. Set [DM13] = 10 (RW10)
- 5. Set [DM10] = 1, The system will execute the data transfer operation.
- d. "Back light control (write back)"

	ack light control"
This o	operation is the same as "Back light control (write back)" except
syste	Sound control"
с. с	
_S	ound
	Sound Library Beep
	Play Trigger mode : OFF->ON
Δ ctiv	ate the [Trigger address], the system will play the sound
	ate the [mgger address], the system will play the sound.
Selec	t a sound from sound library for the PLC Control.
You r	nay configure three different ways to activate the [Trigger addre
(1) 64	rate change from OFF to ON (OFF SON)
(1) 51	ate change from OFF to ON (OFF-20N)
(2) 51	tate change from ON to OFF (ON $>$ OFF)
(2) 0	
(2) 01	late change from ON to OFF (ON->OFF)
(3) St	ate change (either from ON->OFF or OFF->ON)
(3) St (3) St f. "E	ate change (either from ON->OFF or OFF->ON)
(2) St (3) St f. "E	ate change (either from ON->OFF or OFF->ON)
(2) St (3) St f. "E	ate change (either from ON->OFF (ON->OFF) Execute macro program"
(2) Si (3) Si f. "E	tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Setting
(3) St f. "E	tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Address : LB
(3) Si f. "E	tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Address : LB
(2) Si (3) Si f. "E	tate change (either from ON->OFF (ON->OFF) Execute macro program" Trigger address PLC name : Local HMI Address : LB
(2) Si (3) Si f. "E	tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Address : LB O O FF->ON
(2) Si (3) Si f. "E	tate change (either from ON->OFF (ON->OFF) Execute macro program" Trigger address PLC name : Local HMI Address : LB Trigger mode : OFF->ON
(2) Si (<u>3</u>) Si f. "E	tate change (either from ON->OFF (ON->OFF) Execute macro program'' Trigger address PLC name : Local HMI Address : LB Trigger mode : OFF->ON
(2) SI (3) SI f. "E	tate change from ON to OFF (ON->OFF) tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Setting Address : LB O OFF->ON OFF->ON Trigger mode : OFF->ON
(2) Si (3) Si f. "E	tate change from ON to OFF (ON->OFF) tate change (either from ON->OFF or OFF->ON) Execute macro program" Trigger address PLC name : Local HMI Setting Address : LB O OFF->ON V Trigger mode : OFF->ON V

Note
1. The system performs a <i>background printing process</i> when the
printed window is not the current base window.
2. For a window designed to be printed at background, users should
put neither direct window nor indirect window in it.
